No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Score

RESULT ACPD_M

```
Bairoch A.;

Unpublished observations (FEB-1997).

-I- FUNCTION: Converts holo-ACP to apo-ACP by hydrolytic cleavage of the phosphopantetheine prosthetic group from ACP (By similarity).

-I- CATALYTIC ACTIVITY: Holo-[acyl-carrier protein] + H(2)0 = 4'-
phosphopanetheine + apo-[acyl-carrier protein].

-I- SIMILARITY: Belongs to the acpD family.

-I- CAUTION: THIS IS A CONCEPTUAL TRANSLATION, A FRAMESHIFT WAS
INTRODUCED IN POSITION 74 TO MAXIMIZE THE SIMILARITY WITH OTHER
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SEQUENCE FROM N.A.

-i- CATALYTIC ACTIVITY: Holo-[acyl-carrier protein] + H(2)0 = 4'-phosphopantetheine + apo-[acyl-carrier protein].
-i- SIMILARITY: Belongs to the acpD family.
                                                                                                                                                                                                                                                                                                                Pfam; PF02525; Flavodoxin_2; 1.

"Characterization of carrot pectin methylesterase.";

Cell. Mol. Life Sci. 59:513-518(2002).

-I-FUNCTION: Catalyzes the deesterification of methyl-esterified D-
galactosiduronic acid units in pectic compounds. It participates
in modulating cell wall during fruit ripening, cell wall extension
during pollen germination, and in defense mechanisms against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 MEDLINE-21960069; PubMed-11964128;

-1- SUBUNIT: CARBOXYPEPTIDASE II IS A DIMER, WHERE EACH MONOMER IS COMPOSED OF TWO CHAINS LINKED BY A DISULFIDE BOND (BY SIMILARI)
-1- DEVELOPMENTAL STAGE: EXPRESSED IN THE GERMINATING EMERYO. LOW LEVELS IN THE DEVELOPING ALEURONE AND EMBRYO. ALSO FOUND IN THE ROOTS AND SHOOTS OF THE GROWING SEEDLING.
-1- PTM: THE LINKER PEPTIDE IS ENDOPROTEOLYTICALLY EXCISED DURING ENZYME MATURATION (BY SIMILARITY).
                                                                                                                                                                                                                                                         "The expression of serine carboxypeptidases during germination of the barley grain.";
Proc. Natl. Acad. Sci. U.S.A. 91:8209-8213(1994).
-!- CATALYTIC ACTIVITY: Preferential release of a or lysine residue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       EMBL;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Local
                                     epsilon and theta chains) that associates with a tau subunit. Core dimerizes to form the POLIII' complex. PolIII' associates with the gamma complex (composed of gamma, delta, delta', psi chi chains) and with the beta chain to form the complete DNA polymerase III complex (By similarity).
                                                                                                                                   FUNCTION: DNA polymerase III is a complex, multichain enzyme responsible for most of the replicative synthesis in bacteria. This DNA polymerase also exhibits 3' to 5' exonuclease activity (By similarity).

CATALYTIC ACTIVITY: N deoxynucleoside triphosphate - N diphosphate
                                                                                                              + \{DNA\}(N).

                                                                                                                                                                                                                                                                                                                                                                                                SUBUNIT: DNA polymerase III contains a core (composed of alpha, epsilon and theta chains) that associates with a tau subunit. This core dimerizes to form the POLIII', complex, PolIII', associates with the gamma complex (composed of gamma, delta, delta', psi and chi chains) and with the beta chain to form the complete DNA polymerase III complex. The final composition of the complex is: (alpha, epsilon, theta)[2]-tau[2]-(gamma, delta, delta', psi, chi)[2]-
